

1. Create a Play book to install Apache server on the destination server with yum module install only if the OS is 'RedHat' or 'CentOS' and version 7 and apt module on Ubuntu server
 - Create an Ubuntu machine and install python on it, apt module is used instead of yum in Ubuntu and name of software is apache2 not httpd
2. Create a play book to create testuser1 and testuser2 on all the hosts (use loop)

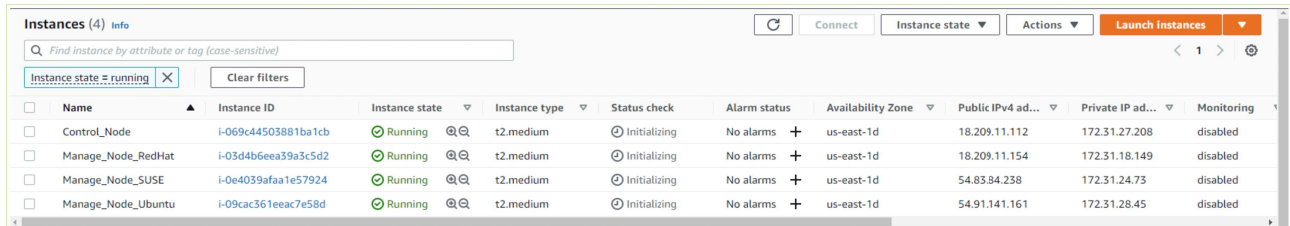

Table of Contents

Step 1 :: Creating EC2 Instances.....	2
Step 2 :: Install Ansible in Control_Node.....	2
Step 3 :: Configuring Ansible in all nodes.....	2
Step 4 :: Setup PasswordLess login to all the Manage Nodes from Control node via ansadmin user.....	3
Step 5 :: Managing inventory file on Master Node.....	3
Task 1 :: Create a Play book to install Apache server on the destination server with yum module install only if the OS is 'RedHat' or 'CentOS' and version 7 and apt module on Ubuntu server.....	4
Task 2 :: Create an Ubuntu machine and install python on it, apt module is used instead of yum in Ubuntu and name of software is apache2 not httpd.....	7
Task 3 :: Create a play book to create testuser1 and testuser2 on all the hosts (use loop)	8

Step 1 :: Creating EC2 Instances

Create 4 instances as below

Control_Node	--> AWS Linux
Manage_Node_RedHat	--> AWS Linux
Manage_Node_SUSE	--> SUSE Linux
Manage_Node_Ubuntu	--> Ubuntu

	Name	Instance ID	Instance state	Instance type	Status check	Alarm status	Availability Zone	Public IPv4 ad...	Private IP ad...	Monitoring
<input type="checkbox"/>	Control_Node	i-069c44503881ba1cb	Running	t2.medium	Initializing	No alarms	us-east-1d	18.209.11.112	172.31.27.208	disabled
<input type="checkbox"/>	Manage_Node_RedHat	i-03d4b6eea39a3c5d2	Running	t2.medium	Initializing	No alarms	us-east-1d	18.209.11.154	172.31.18.149	disabled
<input type="checkbox"/>	Manage_Node_SUSE	i-0e4039afaa1e57924	Running	t2.medium	Initializing	No alarms	us-east-1d	54.83.84.238	172.31.24.73	disabled
<input type="checkbox"/>	Manage_Node_Ubuntu	i-09cac361eeac7e58d	Running	t2.medium	Initializing	No alarms	us-east-1d	54.91.141.161	172.31.28.45	disabled

Step 2 :: Install Ansible in Control_Node

ansible --version

```
[root@ip-172-31-27-208 ~]# ansible --version
ansible 2.9.27
  config file = /etc/ansible/ansible.cfg
  configured module search path = [u'/root/.ansible/plugins/modules', u'/usr/share/ansible/plugins/modules']
  ansible python module location = /usr/lib/python2.7/site-packages/ansible
  executable location = /usr/bin/ansible
  python version = 2.7.18 (default, May 25 2022, 14:30:51) [GCC 7.3.1 20180712 (Red Hat 7.3.1-15)]
[root@ip-172-31-27-208 ~]#
```

Step 3 :: Configuring Ansible in all nodes

useradd ansadmin

Note: use "useradd -m ansadmin" in case of Ubuntu and SUSE servers

passwd ansadmin

visudo

Add below line

ansadmin ALL=(ALL) NOPASSWD: ALL

vi /etc/ssh/sshd_config

Uncomment the below line

"PasswordAuthentication yes"

service sshd restart

Step 4 :: Setup PasswordLess login to all the Manage Nodes from Control node via ansadmin user

```
# su - ansadmin
$ ssh-keygen
$ ssh-copy-id -i /home/ansadmin/.ssh/id_rsa.pub ansadmin@172.31.18.149
$ ssh-copy-id -i /home/ansadmin/.ssh/id_rsa.pub ansadmin@172.31.24.73
$ ssh-copy-id -i /home/ansadmin/.ssh/id_rsa.pub ansadmin@172.31.28.45
```

Step 5 :: Managing inventory file on Master Node

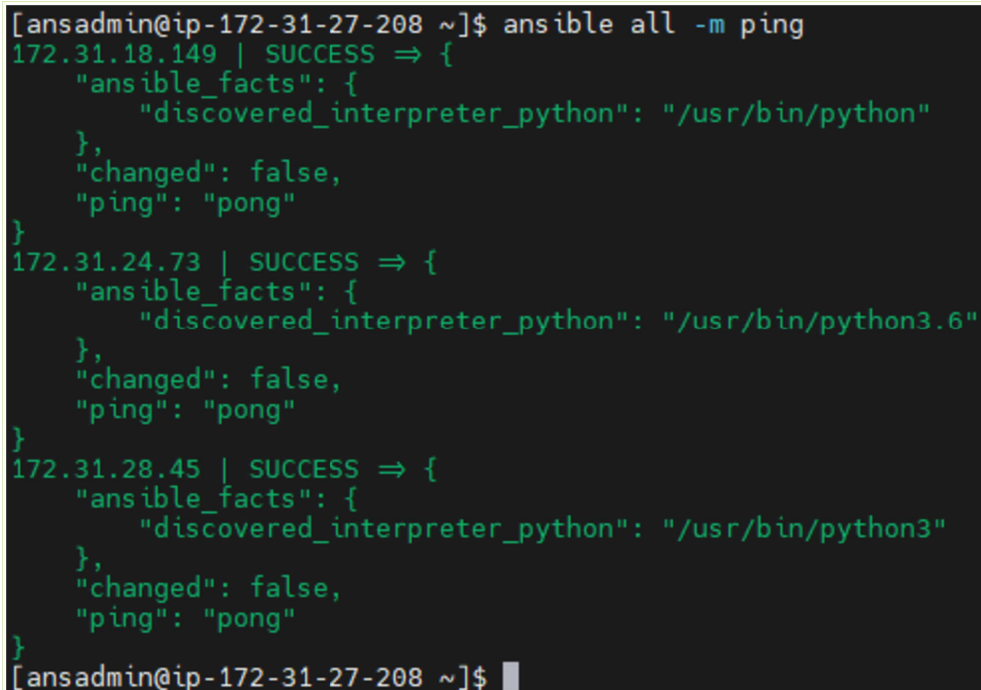

Add the below lines at end of file /etc/ansible/hosts

```
$ sudo vi /etc/ansible/hosts
```

```
[Redhat]
172.31.18.149
[Ubuntu]
172.31.28.45
[Suse]
172.31.24.73
```

Perform Ping test from Control Node to Manage Nodes from ansadmin user

```
$ ansible all -m ping
```

```
[ansadmin@ip-172-31-27-208 ~]$ ansible all -m ping
172.31.18.149 | SUCCESS => {
  "ansible_facts": {
    "discovered_interpreter_python": "/usr/bin/python"
  },
  "changed": false,
  "ping": "pong"
}
172.31.24.73 | SUCCESS => {
  "ansible_facts": {
    "discovered_interpreter_python": "/usr/bin/python3.6"
  },
  "changed": false,
  "ping": "pong"
}
172.31.28.45 | SUCCESS => {
  "ansible_facts": {
    "discovered_interpreter_python": "/usr/bin/python3"
  },
  "changed": false,
  "ping": "pong"
}
[ansadmin@ip-172-31-27-208 ~]$
```

Task 1 :: Create a Play book to install Apache server on the destination server with yum module install only if the OS is 'RedHat' or 'CentOS' and version 7 and apt module on Ubuntu server

```
$ cat apache.yaml
```

```
